  receptor affinity compound
The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of < 8000 Da, and a binding affinity to TR as expressed by an IC50 of no more than about 100 mum. compound (especially if modified, see features table) can be used for
                                                                                                                                                                      mimetic(s) - useful in treathrombocytopenia resulting
                                                                                                                                                                                            Thrombopoietin receptor-binding/activating peptide(s) and pep mimetic(s) - useful in treatment of haematological disorders,
                                                                                                                                                                                                                                                                        WPI; 1997-051883/05.
                                                                                                                                                                                                                                                                                                                     Mattheakis LC,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                          The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia
                                                                                resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to invesmechanism of thrombopoietin signal transduction and receptor or to maintain the proliferation and growth of thrombopoietin
                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, et
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUN-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                      of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimerics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological materials. They may also be used for in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines

          receptor affinity compound
          The present sequence is a compound which binds to thrombopoietin (TPO receptor (TR). It has a molecular weight of <8000 Da, and a binding affinity to TR as expressed by an IC50 of no more than about 100 mum. compound (especially if modified, see features table) can be used for
                                                                                                          Thrombopoietin receptor-binding/activating peptide(s) mimetic(s) - useful in treatment of haematological dis
                                                                                                                                                 WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          thrombocytopenia resulting from chemotherapy, radiation therapy or k marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-JUN-1995;
07-JUN-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thrombopoietin receptor; binding peptide; treatment; agonist; haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18
                                                                                                                                                                                                                                                   resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                            The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1997-052226/05.

                                                                                           CC (XI)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(CC (L2))d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, CC (L2)d-P2-(L3)e-P3, and L4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, CC c, d, e, and f = are each independently 0 or 1, provided that at least 1 or f and b is 1. The composition can have cytostatic, antiasthmatic, CC thrombolytic and immunosuppressive activities. DNAs, vectors and host CC cells from the present invention can be used for producing pharmaceutical CC compositions. The compositions are useful for treating cancer, asthma, CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than CC thrombosis, or autoimmune diseases. The use of an Fc domain (rather than CC such as Fc receptor binding, protein A binding, complement fixation, and CC spossibly placental transfer. AAA69343 to AAA69326 and AAB16935 to CC AAB18003 represent nucleotide and amino acid sequences used in the

                                                                                                                                                                CC bind to and activate the human thrombopoletin receptor (TPO-R). Methods (C of activating thrombopoletin receptors in cells comprise contacting the C cells with effective amounts of peptides and peptide mimetics attached to the C that with effective amounts of peptides and peptide mimetics attached to CC as that due to chemotherapy, radiation therapy or bone-marrow CC transplantation and to prevent thrombocytopenia in patients at risk. The c sequences are used to treat and prevent haematological disorders (C including thrombocytopenia and platelet disorders. They are used in vitro CC as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO CC receptor. The peptides can be used to detect TPO receptors on living CC receptor. The peptides can be used to detect TPO receptors of in the peptides can be used to detect TPO receptors of in purified or natural biological materials. They may also be used for in the staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed committed or in conjunction with additional cytokines

neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for CC diagnosing diseases characterised by dysfunction of their associated CC protein of interest, for identifying normal or abnormal proteins of CC interest, as a part of diagnostic kit to detect the presence of their CC proteins of interest in a biological sample. Additionally, (I) is useful CC for treating inflammatory and autoimmune diseases, tumour growth, cancer, CC refunction darthritis, diabetic retinopathy, obesity, sleep disorders, creating compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPD-mimetic comprising EPO megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic comprise syndrome.                                                                                                                                                                                                                                                                            ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is a TPO mimetic peptide sequence used to make a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New CDR mimetibody comprising a portion of a heavy or light chain variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one human framework region and at least one light chain variable region, which there is a such that the comprises at least one human framework region and at least one light thinding region of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-804237/75
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-MAY-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 10
                                                                                                                                                                                                                                                                                                                                         This invention relates to CH1 deleted mimetibodies (and the DNA sequences which encode them), compositions, methods and uses. The invention may be consequenced them), compositions, methods and uses. The invention may be consequenced to the development of compounds with an immunosuppressive, cardiant, hypotensive, neuroprotective, nootropic, cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, cardiovascular, virucide or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, cardiovascular (for example arrhythmia, typertension or heart immune, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia conflictions, or infectious diseases or disorders, anaemia, cancerous conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases or disorders, anaemia, cancerous conditions, or infectious diseases (for example bacterial, viral or conditions, or infectious diseases or disorders, anaemia, cancerous are fungal infection). The present sequence is that of a peptide which may be used during the creation of a mimetibody of the invention.
                                                                                                                                           Matches
                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fungicide; gene therapy; immune disorder; cardiovascular dise
arrhythmia; hypertension; heart failure; neurodegenerative;

                                                      cc cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen, general cological-Gen, auditory, endocrine-Gen, communomodulator, antiallergic, muscular-Gen, epatotropic, haemostatic, cc immunomodulator, antiallergic, muscular-Gen, cytostatic, cc immunomodulator, antiallergic, muscular-Gen, cytostatic, cc immunomodulator, antiallergic, muscular-Gen, cytostatic, cc respiratory-Gen activity acting as a tumour necrosis factor (TNP)-CC modulator or cytosine-agonist. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or cc present invention are useful for the diagnosis, prevention and/or cc cardiovascular, dental or conditions associated with aberrant expression cc cardiovascular, dental or oral, dermatological, ear, nose or throat, cendocrine, metabolic, gastrointestinal, gynaecological, hepatic, conscentic, haematologic, immunological, allergic, infectious, musculoskeletal, oncological, neurological, nutritional, ophthalmologic, mecalostric, psychiatric, renal or pulmonary disorders. The present cc gedeaters, psychiatric, renal or pulmonary disorders. The present cc mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heavner GA, K
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ophthalmological; nephrotropic; respiratory Gen; tumour necrosis factor.                                                                                              The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                           Sequence 14
                                                                                                                                                                                           Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                    WPI;

07-JUN-1995;
The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of < 8000 Da, and a binding affinity to TR as expressed by an ICSO of no more than about 100 mum. Th compound (especially if modified, see features table) can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUN-1995;

It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  thrombopoietin receptor - useful in treatment of haematological

                                                                                                                                                                                                                                           The present peptide, which binds the thrombopoietin receptor (TR), cused to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used disgnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, e

                                                                                                                                                                                                                                                                                                         The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microw. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia
                                                                                                                                                                                                                                                                                                                                                                                                         Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thrombopoietin receptor; binding peptide; treatment; agonist; haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis;

                                                                                                                                                                                                                                                                                                   The present invention describes composition of matter (I) comprising an CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is: CC (XI)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-CC (L2)d-P2-(D3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active CC peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, CC c, d, e, and f = are each independently 0 or 1, provided that at least 1 CC of a and b is 1. The composition can have cytostatic, antiasthmatic, trambolytic and immunosuppressive activities. DNAs, vectors and host CC cells from the present invention can be used for producing pharmaceutical CC compositions. The compositions are useful for treating cancer, asthma, CC a Fab domain or antoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions and

                                                                                                                                                                                                                  8
Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods CC of activating thrombopoietin receptors in cells comprise contacting the CC ells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such CC as that due to chemotherapy, radiation therapy or bone-marrow CC transplantation and to prevent thrombocytopenia in patients at risk. The Sequences are used to treat and prevent basentological disorders CC including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin CC receptor. The peptides can be used to detect TPO receptors on living C cells and fixed cells, in biological fluids, in tissue homogenates, and C in purified or natural biological materials. They may also be used for in Situ staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed committed committed or in conjunction with additional cytokines
                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                              Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that CC bind to and activate the human thrombopoietin receptor (TPO-R). Methods CC of activating thrombopoietin receptors in cells comprise contacting the CC ells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such CC as that due to chemotherapy, radiation therapy or bone-marrow CC transplantation and to prevent thrombocytopenia in patients at risk. The Sequences are used to treat and prevent haematological disorders CC including thrombocytopenia and platelet disorders. They are used in vitro CC as unique tools for understanding the biological role of thrombopoietin CC (TPO) and to develop other compounds that bind to and activate the TPO CC cells and fixed cells, in biological fluids, in tissue homogenates, and CC in purified or natural biological materials. They may also be used for in Stu staining, fluorescence-activated cell sorting, Western blotting and centre of the sead for in vitro expansion of megakaryocytes and their committed CC progenitors alone or in conjunction with additional cytokines
                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                        맑
                                                                                                                                                                                                                                                                                        á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow is transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in stau metaling, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and their committed controlled to the peptides can be used for in vitro expansion of megakaryocytes and the peptides can be used for in vitro expansion of megakaryocytes and the peptides can be used for in vitro expansion of megakaryocytes and the peptides can be used to the peptides can be use
                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                07-JUN-1995;

cc neuroprotective activities. (I) can be used as a therapeutic or cycophylactic agent as well as for screening purposes. (I) is useful for cdiagnosing diseases characterised by dysfunction of their associated comprotein of interest, for identifying normal or abnormal proteins of cinterest, as a part of diagnostic kit to detect the presence of their comproteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, creating their compounds are useful for treating diseases, tumour growth, cancer, creatility, and neurological degenerative diseases, tumour growth, cancer, creatility, and neurological degenerative diseases. (I), comprising EPO-compounds are useful for treating discorders characterised by low cred blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic cumour which result in thrombocytopaenia, systemic lupus erythematosus, cand Fanconi's syndrome. ABB72403 to ABB73426 and ABI35695 to ABI35777 represent amino acid and nucleic acid sequences used in the

                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                             This invention relates to novel mammalian CDR mimetibodies, specific CC portions or variants thereof. Specifically, it refers to an antibody CC fragment where a protein has been inserted into, or replaces a portion CC of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one CC ligand binding region (LBR). The present invention describes human framework region and at least one mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic CC plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms CC preparing compositions for modulating, treating or reducing the symptoms CC preparing compositions for modulating, treating or reducing the symptoms CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This controls as a market a series of the corrective activities. This

                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                           which encode them), compositions, methods and uses. The invention may be cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, tissue, organ or animal, specifically for modulating, treating, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia conditions, or infectious diseases (for example bacterial, viral or fungal infection). The present sequence is that of a peptide which may be useful for creation of a mimetibody of the invention.
                                                                                                                                                                                                                                                           Matches

It can also be used disgnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines

                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-JUN-1995;

Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                              Activating thrombopoietin receptors in cells, used to treat thrombocytopenia and hematological disorders, comprises con with peptides and peptide mimetics attached to hydrophilic:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cells and fixed cells, in biological fluids, in tissue homogenates, a in purified or natural biological materials. They may also be used for situ staining, fluorescence-activated cell sorting, Western blotting enzyme-linked immunosorbent assay (ELISA). In addition, the peptides be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines
                                                                         Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide mimetic; human; thrombopoietin receptor; TPO-R; TPO; cytokine; haemostatic; thrombocytopenia; chemotherapy; radiation therapy; ELISA; bone marrow transplantation; haematological disorder; platelet disorder; enzyme-linked immunosorbent assay; in situ staining; biological fluid; tissue homogenate; fluorescence-activated cell sorting; Western blotting;
transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understranding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO
                                                                                                                                                                                                                 Activating thrombopoietin receptors in cells, used to treat thrombocytopenia and hematological disorders, comprises contacting with peptides and peptide mimetics attached to hydrophilic polymer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human thrombopoietin receptor (TPO-R)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAU25984 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines
              The present peptide, which binds the thrombopoietin receptor (TR), used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thrombopoietin receptor; binding peptide; treatment; agonist; haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis;

                                                                                                                                                                   sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoletin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines
                                                                                                                                                                                                                                                                                                                                                               Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Activating thrombopoietin receptors in cells, used to treat thrombocytopenia and hematological disorders, comprises contacting cells with peptides and peptide mimetics attached to hydrophilic polymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide mimetic; human; thrombopoietin receptor; TPO-R; TPO; cytokine; haemostatic; thrombocytopenia; chemotherapy; radiation therapy; ELISA; bone marrow transplantation; hematmological disorder; platelet disorder; enzyme-linked immunosorbent assay; in situ staining; biological fluid; tissue homogenate; fluorescence-activated cell sorting; Western blotting; in vitro expansion; megakaryocyte; Headpiece Dimer gene; lacI gene.
